Sure! Here's a tabular representation outlining the differences between schedule triggers, event-based triggers, and tumbling triggers in the context of a pipeline:

Triggers	Description	Examples
Schedule Triggers	These triggers execute a pipeline on a predefined schedule.	- Run pipeline every hour
		- Run pipeline every day at 9 AM
		- Run pipeline every Monday and Friday
Event-based Triggers	These triggers execute a pipeline when a specific event occurs, such as a file being uploaded or a message being received.	- Run pipeline when a new file is added to a directory
		- Run pipeline when a new message is received in a queue
		- Run pipeline when a database record is updated
Tumbling Triggers	These triggers execute a pipeline based on a time window or interval.	- Run pipeline every 5 minutes
		- Run pipeline every hour, processing data from the previous hour
		- Run pipeline every day, processing data from the previous day

Note: This table provides a general overview of these triggers. The actual implementation
